The Construction Series- Material Lifters

Construction – Material lifters

This week's construction edition will focus on lifting/carrying heavy and awkward construction materials. We have all seen overhead cranes, forklifts and pallet jacks, but here are some ideas for handling more awkward items when on a worksite.

Drywall Panel Lifters

Drywall lifters eliminate the need for lifting and holding heavy sheets of drywall overhead and allow one person to complete this task.

$500- $700

Manual Jacks

This manual jack can be used to raise materials and level them before securing in place, eliminating the need for a worker to lift and hold the materials. This is another tool that allows an IIP to work independently and in a safe manner.

$30-$50

Door Lifter

A door lifter is a handy tool that will allow a worker to safely hang a door on their own and maintain good upright posture with less effort.

$30- $50

Quick Cut Concrete Saw Carts

Why carry a heavy and cumbersome quick cut concrete saw when it can be mounted on a cart and you can push while operating? Not only does this cart eliminate the lifting, it improves postures while operating the saw.

$500-$900 (saw not included)

Panel Carrier Tool

We have previously shown you lifting straps but this panel carrier tool fits around the item to be lifted and provides a handle that allows IIP to maintain good wrist posture and a comfortable power grip. No need to walk backwards while carrying large awkward products such as panels.

$300
